

Final project

1. Objective

To create an **AGENTS.md** file that directs an AI to train a machine learning **classification** model on the '**creditcard_train**' dataset and evaluate it on the '**creditcard_test**' dataset, with the goals of maximizing the **AUC** and minimizing **token** usage.

2. Tool

- 2.1. OpenCode (<https://opencode.ai/>)
- 2.2. Model (up to you)

3. Dataset

- [Download dataset](#)

4. To deliver

- 4.1. AGENTS.md
- 4.2. Your prompt
- 4.3. Your AUC score
- 4.4. Your token usage (To collect this number, start a new session and execute your [AGENTS.md](#) file)

Example

1. AGENTS.md

```
# AGENTS.md

## Titanic Classification

### Data Files
- `train_data.csv` — training data (792 rows)
- `test_data.csv` — test data (100 rows, **includes `Survived` labels**)

### Data Schema
- **Label:** `Survived` (binary: 0/1)
```

- **Features (14):** `Sex`, `Age`, `Fare`, `Pclass\_1/2/3`, `Family\_size`, `Title\_1-4`, `Emb\_1-3`
- **Preprocessed:** numeric features scaled (0-1 range), categoricals one-hot encoded
- **No missing values** in current files
- First unnamed column is an index; exclude from features

Workflow

1. Load `train\_data.csv` and `test\_data.csv`
2. Train RandomForestClassifier (`random\_state=42`)
3. Evaluate on test data (confusion matrix, AUC score)
4. Export `predictions.csv` with original test data + `predicted\_label` column

2. Your prompt

“Please execute @AGENTS.md”

3. Your AUC score

0.887

4. Token use

13,783

Appendix

To start using OpenCode, type command

1. `/models`
2. `/init`
3. `/new`
4. Your prompt
